

Entitlement Manager for File Servers

THE SITUATION

Ensuring mandatory access control across file servers is extremely difficult in today's enterprise: servers are distributed, housed on premise and in the cloud, and often managed by different administrators. IT must have the ability to update controls in response to frequently changing user job responsibilities, project assignments, and shifting requirements, as well as maintain visibility into access control events for auditing and troubleshooting.

Microsoft's discretionary access control model simply can't keep pace with these requirements, which leaves over-burdened IT teams struggling to meet compliance, governance, and risk management objectives.

THE SOLUTION

NextLabs Entitlement Manager for Microsoft File Servers provides out-of-the-box integration with CIFS/SMB, Samba, and NFS file servers to offer fined-grained, unified access control and audit capabilities across file servers and other applications. The solution is easily deployed with no change to network infrastructure and zero-perceptible latency to end-users.

THE RESULTS

■ Unify Access Control Across All File Servers

Control access across file servers, monitor user activities in real-time with summary dashboards, event details, and alerts, track behavior over time

■ Control Access by Mobile Users and Unmanaged Hosts

Prevent unauthorized file server access by mobile users on unmanaged hosts from unknown locations or devices

■ Protect Data with Advanced Access Control

Provide granular access control for file servers based on a variety of variables, including user, location, network connection, requesting host, and data classification or content

■ Centrally Manage Enterprise-wide Access Control and Audit

Reduce management and compliance cost with centralized access control administration and access auditing across all file servers

■ Support File Server, SharePoint, and Other Applications in one Integrated System

Deploy as an integrated component of an enterprise entitlement management solution encompassing file servers, Microsoft SharePoint, enterprise applications, and data protection

DYNAMIC AUTHORIZATION ACROSS FILE SERVERS AND APPS

Traditional file server access controls are container-based and discretionary, meaning controls target specific network locations and trust end users to be both informed and compliant (by storing information in the correct locations). Administering these container-based controls (user groups and permissions) can be both cumbersome and expensive especially when teams try to implement complex requirements across multiple systems.

Dynamic authorization is an approach that complements and extends container-based controls by controlling access based on metadata, user attributes, and other factors—across all file servers at once. Data is protected no matter where it is stored, and there is no need to maintain multiple sets of cumbersome, container-based controls.

STANDARDS-BASED APPROACH

NextLabs Entitlement Manager for File Servers is based on eXtensible Access Control Markup Language (XACML), the industry standard for Attribute Based Access Control (ABAC). A single set of digital policies can be deployed across all Windows and Linux File Servers, Microsoft SharePoint, and enterprise Line of Business (LOB) applications.

INTEGRATION WITH EXISTING INFRASTRUCTURE

NextLabs' Attribute Based Access Control can extend native Permissions and Security Groups already maintained in Active Directory, so IT teams do not need to overhaul its security infrastructure in order to complement their existing security with dynamic authorization.

The Entitlement Manager for File Servers also integrates with Microsoft Dynamic Access Control (DAC) and File Classification Infrastructure (FCI), allowing IT to control access based on user and device claims and resource properties.

CENTRALIZED AUDIT AND REPORTING

Policy compliance and end user activity are collected in a central Activity Journal for reporting by NextLabs Reporter, a graphical analysis, charting, and reporting application.

ENTITLEMENTS FOR MOBILE USERS AND UNMANAGED HOSTS

The Entitlement Manager for File Servers can manage access by mobile users and unmanaged hosts using intelligent host recognition which dynamically controls access based on host name, domain, platform, country, or site location. This can be done without installing any software on the client. Example controls can include:

- Prevent file server access from unmanaged hosts, such as visitor and contractor laptops
- Restrict access to select shared folders from internal network or from a specified office branch or location
- Prevent mobile users from downloading document via remote connections

SPECIFICATIONS

Feature	Support
File Server Integration	Out-of-the-box integration with CIFS/SMB, Samba, and NFS file servers
NextLabs Product Compatibility	Control Center, version 6.5 and above Server Policy Controller for Microsoft Windows, version 6.5 and above Rights Management Server, version 6.5 and above

ABOUT NEXTLABS

NextLabs®, Inc. provides data-centric security software to protect business critical data and applications. Our patented dynamic authorization technology and industry leading attribute-based policy platform helps enterprises identify and protect sensitive data, monitor and control access to the data, and prevent regulatory violations – whether in the cloud or on premises. The software automates enforcement of security controls and compliance policies to enable secure information sharing across the extended enterprise. NextLabs has some of the largest global enterprises as customers and has strategic relationships with industry leaders such as SAP, Siemens, Microsoft, and IBM. For more information on NextLabs, please visit <http://www.nextlabs.com>.
